

Fix solaris 11 iconv

How to fix the iconv installation on an Solaris 11 box/zone

On a Solaris 11 box with installed amp package (apache22 and php53 and iconv), this is a standard situation:

```
$ iconv -l  
Failed to open the directory /usr/lib/iconv/geniconvtbl/binarytables/.
```

This also leads to errors with PHP iconv-based functions, like:

```
14:07 core.ERROR: exception 'Zend_Locale_Exception' in .../engine/Library/Zend/Locale/Format.php:351  
Stack trace:  
#0 .../engine/Library/Zend/Currency.php(194): Zend_Locale_Format::toNumber(1337.81, Array)
```

Solution: install pkg unicode-core.
